Memory chip heatsinks are devices used for cooling, typically used on computer memory modules. Their main function is to increase the surface area for better heat dissipation, thus maintaining the stability and reliability of the memory chips.

Memory chip heatsinks are typically made of metal materials such as aluminum alloy or copper. They are designed based on the principle of heat sinks, with many small fins that increase the surface area for better heat dissipation. Additionally, some memory chip heatsinks are equipped with fans for further cooling.
