Abstracts

The global MEMOS Tubular Ultrafiltration Membrane market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

MEMOS tubular ultrafiltration membrane is an ultrafiltration membrane module composed of multiple tubular membranes. It is composed of a series of elongated tubular membranes arranged together to form an overall membrane module. Each tubular membrane has micropores that filter out solutes and suspended solids while retaining the solvent and low molecular weight components of the solute. The tubular membrane of MEMOS tubular ultrafiltration membrane is usually made of polymer materials, such as polyamide, polyethersulfone, etc. These materials have good chemical stability and mechanical strength and can withstand operation under high pressure and high temperature conditions. The tube diameter and pore size of MEMOS tubular ultrafiltration membranes can be selected and adjusted according to the needs of specific applications. Generally, membranes with smaller tube diameters provide higher separation efficiency, while membranes with larger tube diameters provide higher flux. MEMOS tubular ultrafiltration membranes use the pore size of the membrane to separate different components in the liquid through the flow of liquid in the membrane module. The solute and suspended solids are blocked on one side of the membrane, while the low molecular weight components of the solvent and solute can enter the other side of the membrane through the micropores, thereby achieving separation and concentration of the liquid. MEMOS tubular ultrafiltration membranes have the characteristics of high separation efficiency, adjustable separation range, high throughput, and easy maintenance and cleaning. Therefore, they are widely used in water treatment, food and beverage, biomedicine and other fields.
