Meningococcal disease vaccination is a biological material given to prevent meningitis, a contagious disease of the membranes surrounding the spinal cord and brain. Conjugate, polysaccharide, and subcapsular meningococcal vaccines are the three main types of meningococcal vaccinations. They target meningococcal bacteria A, B, C, W-135, and Y and are given to new-borns, children, and adults to immunize them against the invasive disease. Antibodies are generated after the vaccination is given to combat the bacteria and develop an immune response to prevent infection.
