It is an instrument used to measure the porosity of materials. The working principle of the instrument is to use compressed air to push mercury into the pores of the material, measure the amount of mercury pushed in, and then calculate the porosity of the material. This kind of instrument is usually used to measure the porosity of building materials and soil. Its advantages are high measurement accuracy, fast test speed, and convenient use. However, it also has certain safety risks and requires attention to safe operation.
