## Abstracts

According to our (Global Info Research) latest study, the global Meso-Erythritol market size was valued at USD 325.8 million in 2023 and is forecast to a readjusted size of USD 357.6 million by 2030 with a CAGR of 1.3% during review period.

Meso-Erythritol (C<sub>4</sub>H<sub>10</sub>O<sub>4</sub>; CAS NO. 149-32-6; Erythritol; Phycitol; Erythrit; Phycite) is a four-carbon sugar that is found in algae, fungi, and lichens. It is twice as sweet as sucrose and can be used as a coronary vasodilator.

Erythritol occurs widely in nature and has been found to occur naturally in several foods including wine, sake, beer, water melon, pear, grape and soy sauce. Evidence indicates that erythritol also exists endogenously in the tissues and body fluids of humans and animals. Erythritol is absorbed from the proximal intestine by passive diffusion in a manner similar to that of many low molecular weight organic molecules which do not have associated active transport systems, the rate of absorption being related to their molecular size; erythritol, a 4-carbon molecule, passes through the intestinal membranes at a faster rate than larger molecules such as mannitol or glucose. In diabetics, erythritol also has been shown to be rapidly absorbed and excreted unchanged in the urine. Following absorption, ingested erythritol is rapidly distributed throughout the body and has been reported to occur in hepatocytes, pancreatic cells, and vascular smooth muscle cells. Erythritol also has been reported to cross the human placenta and to pass slowly from the plasma into the brain and cerebrospinal fluid.

Japan is the largest producer of Meso-Erythritol, with a market share about 35%, followed by North America and China, etc. Cargill, Mitsubishi, Nikken-chemical, Baolingbao Biology and Shandong Sanyuan Biotechnology are the top 5 manufacturers of industry, and they had about 85% combined market share.
