Abstracts

The global Meta-xylene market size is expected to reach \$ 3869 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Meta-xylene (m-xylene) is an aromatic hydrocarbon with the formula C_8H_{10} and one of the three xylene isomers (ortho-, meta-, and para-xylene). In industry, it is typically recovered from reformat or other refinery/petrochemical aromatic streams and may be obtained through separation and/or xylene isomerization/separation schemes, then used as a chemical intermediate feedstock or as an industrial solvent. In 2025, global Meta-xylene sales reached approximately 2,900 kilotons, with an average price of 920 US\$/Ton.

Demand for Meta-xylene is fundamentally tied to derivative chain throughput, especially where it serves as a primary feedstock for oxidation routes to isophthalic acid and related intermediates, creating structurally 'sticky' consumption in integrated aromatics-to-acids value chains that prioritize continuous operation and feedstock reliability.

Solvent uses in coatings, inks, adhesives, and similar applications add a secondary layer of volume, but overall market momentum is largely shaped by the operating rates and expansion decisions of downstream resin, polyester-modification, and specialty intermediate producers that convert m-xylene into higher-value products.

This report studies the global Meta-xylene production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Meta-xylene and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year. This report explores demand trends and competition, as well as details the characteristics of Meta-xylene that contribute to its increasing demand across many markets.
