## Abstracts

According to our (Global Info Research) latest study, the global Metacentric Height Apparatus market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Metacentric height apparatus is a device used to determine the stability of floating or submerged bodies, particularly ships and other water-based structures. It involves a physical model or a real-scale representation of the object being tested. By tilting the model and observing the equilibrium conditions, the metacentric height (a key stability parameter) can be calculated. The metacentric height helps assess the tendency of the object to return to its upright position after being tilted.
