The global Metacentric Height Apparatus market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Metacentric height apparatus is a device used to determine the stability of floating or submerged bodies, particularly ships and other water-based structures. It involves a physical model or a real-scale representation of the object being tested. By tilting the model and observing the equilibrium conditions, the metacentric height (a key stability parameter) can be calculated. The metacentric height helps assess the tendency of the object to return to its upright position after being tilted.

This report studies the global Metacentric Height Apparatus production, demand, key manufacturers, and key regions.
