Abstracts

Metakaolin-based geopolymer refers to a type of geopolymer composite material primarily composed of metakaolin, which is a thermally activated form of kaolinite clay. Geopolymers are inorganic aluminosilicate materials formed through the polymeric network structure created by the reaction between aluminosilicate precursors and alkaline activators. Metakaolin, derived from the calcination of kaolinite clay at high temperatures, serves as a key precursor in the formation of geopolymer matrices, offering enhanced mechanical properties, durability, and environmental sustainability compared to traditional cementitious materials.

According to our (Global Info Research) latest study, the global Metakaolin-Based Geopolymer market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
