According to our (Global Info Research) latest study, the global Metal-Based Self-Lubricating Bearings market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Metal-based self-lubricating bearings are bearings that use metal materials as the base and are coated with a layer of self-lubricating material on the surface. They are used to operate under harsh conditions such as high temperature, high speed, and high load. Self-lubricating materials are usually composite materials composed of one or more solid lubricants and one or more polymer materials, which can automatically release and replenish lubricating oil when the bearing is running, thereby achieving long-term stable operation of the bearing. Metal-based self-lubricating bearings have excellent properties such as wear resistance, high temperature resistance, corrosion resistance and fatigue resistance. They are suitable for high-end equipment and important parts in aviation, aerospace, military industry, machinery and other fields. They are a high-performance bearing type.
