## Abstracts

A metal bevel gear is a type of gear used in mechanical systems to transmit power between non-parallel shafts. Unlike spur gears, which have teeth that are parallel to the axis of rotation, bevel gears have teeth that are formed along the surface of a cone. This allows bevel gears to change the direction of power transmission and adjust the speed and torque between intersecting shafts. Metal bevel gears are typically made from materials such as steel, stainless steel, or other metals, chosen for their strength, durability, and resistance to wear. They are commonly used in applications where high torque and precision are required, such as in automotive differentials, power tools, industrial machinery, and marine propulsion systems.

According to our (Global Info Research) latest study, the global Metal Bevel Gear market size was valued at US\$ 2646 million in 2023 and is forecast to a readjusted size of USD 3217 million by 2030 with a CAGR of 2.9% during review period.
