Abstracts

According to our (Global Info Research) latest study, the global Metal Corrugated Composite Gaskets market size was valued at US\$ 177 million in 2025 and is forecast to a readjusted size of US\$ 241 million by 2032 with a CAGR of 4.5% during review period.

The metal corrugated composite gasket (also known as the metal corrugated gasket) is a high-performance mechanical sealing component. It features a metal core with concentric corrugated teeth, surfaced with non-metallic materials such as flexible graphite or PTFE. This design combines the rigidity and strength of metal with the elasticity of the corrugations, enabling excellent sealing performance and resilience?even under low preload conditions.

Upstream materials for these gaskets primarily consist of the metal core and the soft sealing facing. Metal cores are typically made from thin sheets or strips of stainless steel, carbon steel, nickel-based alloys, copper, or aluminum; stainless steel is suitable for general chemical, steam, and thermal cycling applications, while nickel-based alloys are preferred for demanding environments involving high temperatures, severe corrosion, or nuclear power. Flexible graphite is the most common facing material, suitable for high-temperature, steam, oil and gas, and refining applications; PTFE and expanded PTFE are better suited for highly corrosive media, clean chemical processing, and the food and pharmaceutical industries; and mica or vermiculite-based materials are used for ultra-high-temperature or oxidation-resistant applications.

In 2025, global sales volume is approximately 11.5 million units, with a mainstream ex-factory price of roughly \$13?16 per unit and gross profit margins for leading

manufacturers ranging from 25% to 42%.
