## Abstracts

According to our (Global Info Research) latest study, the global Metal Deburring Services market size was valued at US\$ 523 million in 2025 and is forecast to a readjusted size of US\$ 755 million by 2032 with a CAGR of 5.5% during review period.

Metal deburring services use specialized techniques and equipment to remove burrs, flash, and other residue from metal workpiece edges during machining processes such as cutting, stamping, casting, and additive manufacturing. Their core purpose is to improve workpiece precision, safety, and surface quality to meet the stringent demands for product reliability and aesthetics in the automotive, aerospace, and medical device sectors, while also preventing functional failures or assembly issues caused by burrs.

The market prospects for metal deburring services are deeply intertwined with the trends of automation, precision, and new material applications in manufacturing, and are rapidly evolving towards 'intelligentization, integration, and specialization.' Firstly, with the decreasing cost and increasing precision of industrial robots and machine vision technologies, adaptive grinding by robots based on 3D vision recognition and force control feedback will become mainstream, solving the automation challenges of deburring complex curved surfaces and significantly replacing unstable manual operations. Secondly, service models will evolve from single-process processing to 'one-stop' precision machining units highly integrated with online inspection, cleaning, rust prevention, and data traceability, providing customers with complete edge quality solutions. Furthermore, emerging manufacturing sectors are creating new demands: large and complex structural components such as aluminum alloy die-cast bodies and battery trays for new energy vehicles pose new challenges to efficient and non-destructive deburring processes; the removal of support supports and the finishing of

complex internal cavity surfaces in additive manufacturing metal parts will open up entirely new service tracks. Simultaneously, environmental pressures will drive green processes such as dry ice blasting and laser processing to replace some traditional chemical or dust-generating processes. Overall, the technological barriers and perceived value of this service industry will continue to rise, and comprehensive solution providers with advanced process databases, intelligent equipment, and cross-industry application experience will gain a significant competitive advantage, with market concentration expected to gradually increase.
