Metal film heating element is a kind of heating element made of metal foil into various resistance circuits and sandwiched between two layers of insulating sheets. This kind of heating element uses the Joule heating effect generated when current passes through the metal resistance circuit to heat, and has the advantages of small size, light weight, uniform heating, and high thermal efficiency. Metal foil is usually made of special alloy materials, and its thickness generally ranges from 10-50 microns to ensure good conductivity and mechanical strength. The insulating layer is selected according to conditions such as heating temperature and use environment to ensure the safety and reliability of the heating element.
