## Abstracts

According to our (Global Info Research) latest study, the global Metal Polishing Compounds market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Metal polishing compounds typically consist of abrasive particles suspended in a binding agent or wax. The abrasive particles can be made of various materials, such as aluminum oxide, diamond dust, or silica, depending on the specific application and desired level of polishing.

Environmental friendliness and sustainability is one of the main trends in the field of metal polishing fluids today. Manufacturers are increasingly focusing on developing environmentally friendly, low VOC (Volatile Organic Compounds) and low-polluting polishing fluids to minimise the adverse impact on the environment. The use of aqueous polishing fluids is gradually increasing as they are relatively safer, environmentally friendly and excel in removing dirt and providing a bright finish. Water-based fluids also reduce the risk of fire and explosion. Manufacturers seek to develop more efficient polishing fluids to improve productivity. These fluids may include properties that quickly remove oxidation and imperfections, thereby reducing processing time. Some polishing fluids are designed to be multifunctional and can be used for different types of metals and different polishing tasks. This reduces inventory and costs. With developments in fields such as microelectronics, aerospace and medical devices, the need for high precision polishing of metal parts has increased. Manufacturers of polishing fluids are conducting research in developing more precise products. Automated and roboticised production lines are becoming more common and polishing fluids need to be adapted to these automated systems. Automated polishing systems require highly stable and

controllable fluids.
