According to our (Global Info Research) latest study, the global Metal Sintered Filter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A sintered filter is porous, often, cylindrical metallic part manufactured through the process of sintering. Copper and metal alloys are mixed together and fused through high temperatures achieving porosity and creating a mesh. Sintered metal filter elements can be made with sintered wire mesh, sintered metal fiber felt and sintered porous metal powder. Sintered filters perform a very specific task and it is useful in multiple fields of applications, depending upon the microns of porousness. Sintered filter elements are made of stainless steel, bronze, nickel based alloy, titanium and special alloyed powders or stainless steel fibre felt.
