The global Metal Sintered Filter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A sintered filter is porous, often, cylindrical metallic part manufactured through the process of sintering. Copper and metal alloys are mixed together and fused through high temperatures achieving porosity and creating a mesh. Sintered metal filter elements can be made with sintered wire mesh, sintered metal fiber felt and sintered porous metal powder. Sintered filters perform a very specific task and it is useful in multiple fields of applications, depending upon the microns of porousness. Sintered filter elements are made of stainless steel, bronze, nickel based alloy, titanium and special alloyed powders or stainless steel fibre felt.
