## Abstracts

According to our (Global Info Research) latest study, the global Metal Sputtering Target market size was valued at US\$ 4317 million in 2025 and is forecast to a readjusted size of US\$ 7088 million by 2032 with a CAGR of 7.4% during review period.

Sputtering is the process of forming a thin film when the object is attached to the target substrate by the sputtering and scattering, and the sputtering target is the material for high-speed particle bombardment. Metal Target Materials are kinds of sputtering targets and this report studies the Metal Target Material.

A sputtering target is a material that is used to create thin films in a technique known as sputter deposition, or thin film deposition. During this process the sputtering target material, which begins as a solid, is broken up by gaseous ions into tiny particles that form a spray and coat another material, which is known as the substrate. Sputter deposition is commonly involved in the creation of semiconductors and computer chips. As a result, most sputtering target materials are metallic elements or alloys, although there are some ceramic targets available that create hardened thin coatings for various tools.

The global metal sputtering target development and production mainly concentrated in the Europe, United States and Japan, and the industry concentration is quite high. Manufactures of sputtering targets, represented by Materion (Heraeus), Mitsui Mining & Smelting, Praxair, JX Nippon Mining & Metals Corporation, Plansee SE, Hitachi Metals, Honeywell, Sumitomo Chemical, ULVAC and others. The Top 10 manufacturers accounted for 68.12% of the global revenue share in 2019.

Semiconductor chips, flat panel displays, solar cells and other downstream industries have a higher demand on the product quality and stability. The segment of semiconductor took about 38.93% of the revenue share in 2019, followed by the segment of flat panel display, which took about 35.56%.
