Abstracts

The global Metal Surface Defect Inspection System market size is expected to reach \$ 2023.5 million by 2029, rising at a market growth of 7.6% CAGR during the forecast period (2023-2029).

In the era of Industry 4.0, any flaw in any product will be infinitely magnified and bring about negative effects. The production and operation environment of metal materials is relatively harsh, which leads to various defects on the metal surface, which seriously affects product quality and corporate profits. Therefore, it is particularly important to automatically detect metal surface defects.

The surface defect detection equipment condenses a number of advanced technology applications in the field of machine vision, and uses optical principles to detect possible defects on the product surface through image processing and analysis. When there is a defect in the inspected product, the gray value of the image at the defect is different from the gray value of the standard image. By extracting and selecting the features of the defect image, and then comparing the gray value of the defect image with the gray value of the standard image, it is judged whether the difference exceeds the preset threshold range, thereby judging the detected Whether the product is defective. This is a basic method for surface blemish detection. In the specific detection process, firstly, the CCD industrial camera converts the ingested target into an image signal, transmits it to a dedicated image processing system, and converts it into a digital signal according to the pixel distribution, brightness, color and other information. Then the image system performs various operations on these signals to extract the characteristics of the target, such as: area, length, quantity, position, etc. Output results according to preset tolerances and other conditions, such as: defect, size, angle, offset, number, pass/fail, yes/no, etc.
