## Abstracts

The global Metal Wire Grid Polarizer market size is expected to reach \$ 467 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, global Metal Wire Grid Polarizer production reached approximately 147 k pcs, the average price is 2000 usd/pcs. Metal Wire Grid Polarizer is an optical device used to selectively transmit or block polarized light waves based on their orientation. It consists of a grid-like structure made of thin metal wires that are precisely spaced and oriented to act as a polarizing filter. When unpolarized light passes through this grid, it selectively absorbs light waves vibrating in one direction while allowing light waves vibrating in the orthogonal direction to pass through. This results in the polarization of the transmitted light, making metal wire grid polarizers essential components in various optical systems, including LCD displays, imaging devices, and scientific instruments.

### Market Concentration and Key Players:

Internationally, the market concentration of metal wire grid polarizers is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as Thorlabs and Edmund Optics; from a domestic perspective, metal wire grid polarizers still have a lot of room for development.

### Manufacturing Processes and Market Trends:

The fabrication of metal wire grid polarizers relies on nano-scale microfabrication techniques, the core of which is to form a series of parallel metal nanowires on a substrate with spacing less than the wavelength of light. The mainstream technologies include nanoimprinting, electron beam lithography and holographic lithography, among

which nanoimprinting technology has attracted much attention because of its suitability for mass production. An innovative process combines holographic lithography with oblique evaporation of metal films, simplifying steps and achieving high extinction ratios. The basic manufacturing process involves depositing a metal layer on a substrate such as glass, and then transferring the designed wire grid structure to the metal layer through photolithography, etching, etc.

The current market shows a positive growth trend. The market drive mainly comes from a number of cutting-edge science and technology fields, infrared imaging constitutes the main demand, and projection display, AR/VR equipment and HUD head-up display popularization brought by automobile intelligence are also important driving forces. Market competition is relatively concentrated, with the world's top four manufacturers accounting for more than 80% of the market share. Geographically, North America is the current market leader, but China is active in market increment and technology catch-up and is considered an important source of future growth.

The future development of the industry will focus on further reducing the manufacturing cost of high-performance products through new processes and materials, and expanding applications in a wider range of fields such as consumer electronics and medical health.
