Abstracts

The global Metalized Polypropylene Films market size is expected to reach \$ 15198 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032).

Metallized polypropylene film is a composite material made by vacuum-depositing an extremely thin metal layer (such as aluminum or zinc-aluminum alloy) onto a polypropylene base film. Its core value lies in retaining the excellent electrical properties of the polypropylene base film while endowing the material with unique self-healing properties through metallization. When the film experiences localized breakdown under overvoltage, the metal plating around the breakdown point evaporates instantly, forming an insulating isolation zone, allowing the capacitor to instantly recover its function and significantly improving the long-term reliability of the device. In capacitor systems, aluminum or zinc-aluminum metal layers and polypropylene dielectric typically form the energy storage and insulation unit. Its core characteristics are low dielectric loss, high insulation strength, self-healing ability, and good long-term stability.

In 2025, global Metalized Polypropylene Film sales reached approximately 1,773 K Tons, with an average global market price of around 5,056 US\$/Ton. Production capacity reached 2,500 K Tons, with a gross profit margin of approximately 30%.

From a supply chain perspective, key upstream links include high-purity polypropylene resin, base film stretching and molding, vacuum coating, slitting, and patterned metal layer design. PAN Electronics emphasizes the importance of high-purity, high-isotactic polypropylene, Cosmo showcases various metallization structures such as standard and segmented types, while Steinerfilm defines its capabilities by offering different metallization patterns and custom slitting. In the downstream market, TDK directly

applies its DC bus capacitors to inverters, on-board chargers, and high-voltage DC-DC converters. Vishay clearly categorizes its metallized polypropylene DC link capacitors into automotive and industrial grades, while KEMET targets industrial applications, photovoltaic inverter output filtering, and automotive high-voltage bus filtering. This indicates that automotive electric drives and new energy power electronics have become the core demand areas.
