Metallic Coated Low Emissivity Glass

Residential and commercial building construction plays an important role in driving the demand for low-e glass, and commercial and residential building developers are increasingly investing in energy-efficient glass panel solutions to reduce energy costs. According to the US data of the World Bank, the value of the global construction industry in 2020 will reach 22.04 trillion US dollars. These instances of growth in commercial and residential building construction revenues in the low-e glass market are playing a key role in driving the demand. Low-E glass is rapidly used in modern buildings and green buildings due to energy saving, solar control and advanced thermal insulation properties. Low-E glass can transmit 80% of sunlight by filtering ultraviolet rays (UV) from all directions, which can reduce energy costs for buildings, not only in winter, Low-E glass also helps to reduce heat gain in summer, thereby reducing the use of air conditioning. According to the U.S. Department of Energy, low-e glass can reduce energy loss by as much as 30% to 50%. The adoption of low-e glass panels is gaining popularity among residential and commercial builders, developers, architects, and green building contractors due to energy-saving factors, and conscious efforts to reduce energy consumption in the residential and commercial sectors are driving the demand for low-e glass. Low-E glass is also an important solution for enhancing window performance by acting as a thermal barrier to prevent energy loss. In addition,

automakers are shifting the adoption of ordinary glass to low-e glass for better mileage performance, solar control and thermal insulation, and lower CO₂ emissions. In addition, the properties of Low-E glass contribute to lower U-value and shading coefficient (SC), thereby contributing to the overall energy efficiency of the vehicle. Reduced energy costs through reduced carbon footprint is an important factor driving the growth of the low-e glass market revenue.
