## Abstracts

The global Metallized Plastic Film Capacitor market size is expected to reach \$ 2473 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

Metallized plastic film capacitors are capacitors made with plastic films such as polypropylene and polyester as the dielectric, and aluminum, zinc aluminum alloy or other metal layers deposited on the surface of the film as electrodes. The core characteristics are low dielectric loss, high insulation resistance, strong voltage resistance, good frequency characteristics, strong self-healing ability, long service life and high safety. Its working principle is to form an electric field between two layers of metallized thin films and store electrical energy. When the local dielectric breakdown occurs, the metallized layer around the breakdown point will instantly evaporate and isolate the defect area, thereby avoiding continuous short circuit. This product can be divided into DC support capacitors, AC filtering capacitors, safety capacitors, pulse capacitors, absorption capacitors, resonant capacitors, and power factor correction capacitors. It is widely used in new energy vehicle electric drive inverters, photovoltaic inverters, energy storage inverters, industrial frequency converters, home appliance power supplies, switch mode power supplies, rail transit, grid compensation, lighting power supplies, and consumer electronics. It is an important basic component for filtering, energy storage, voltage stabilization, surge absorption, interference suppression, and power quality improvement in power electronic systems. In 2025, global Metallized Plastic Film Capacitor production reached approximately 3,367M Units, with an average global market price of around US\$ 0.49 per unit.

Metallized plastic film capacitors belong to a sub category in the capacitor industry that requires high reliability and safety. The market demand is gradually expanding from

traditional home appliances, power supplies, and lighting fields to high-power scenarios such as new energy vehicles, photovoltaic energy storage, industrial automation, rail transit, charging piles, data center power supplies, and smart grids. Around 2025, the requirements for high voltage resistance, low loss, high ripple current, and long lifespan of DC support capacitors in new energy vehicle electric drive systems and photovoltaic inverters will be raised, promoting an increase in the proportion of high-end metallized polypropylene film capacitors; Meanwhile, household appliances, industrial motors, and power input terminals still provide stable requirements for AC filtering, safety suppression, and motor operation capacitors. In terms of industry competition, the price competition of low-end general products is more obvious, and enterprises mainly rely on scale, cost, and delivery capability to compete; High end power electronics products rely more on the quality of thin film media, metallization evaporation process, winding tension control, potting materials, thermal design, failure control, vehicle certification, and customer joint verification capabilities. The future growth opportunities mainly focus on high-voltage platforms for new energy vehicles, silicon carbide power device matching, high-power photovoltaic inverters, expansion of energy storage converters, industrial frequency conversion energy-saving transformation, and upgrading of high reliability and safety capacitors. Enterprises with film material matching, metallization process, modular packaging, and high-end customer certification capabilities are more likely to obtain high value-added orders.
