Abstracts

The global Metallographic Polishing Machine market size is expected to reach \$ 173 million by 2032, rising at a market growth of 2.7% CAGR during the forecast period (2026-2032).

In 2025, global Metallographic Polishing Machine production reached approximately 36.8 k units, with an average global market price of around US\$3,797 per unit. A metallographic polishing machine is a machine for polishing samples. It consists of basic components such as a base, a polishing plate, a polishing fabric, a polishing cover and a cover. Polishing removes abrasions from the previous steps to provide a smooth surface.

The global metallographic polishing machine market is undergoing a critical transition from traditional manual preparation to high-level automation and intelligent integration. As sectors such as aerospace, semiconductors, and new energy vehicles impose increasingly stringent requirements for high-performance material characterization, the consistency and reproducibility of sample preparation have become core priorities. Market drivers primarily stem from the heightened need for failure analysis and precision quality control in downstream industries, pushing equipment design toward integrated multi-process linkages, precise pressure control, and automated consumable dispensing systems. Continuous government investment in R&D for high-end manufacturing has further stimulated the upgrading of laboratory testing infrastructure. Current technical evolution focuses on optimizing grinding and polishing parameters through digital feedback mechanisms to address the stress sensitivity challenges of complex composites and ultra-thin wafer substrates during processing. Although the competitive landscape is shifting with the relocation of manufacturing hubs, systematic solutions offering superior process stability and minimized human interference remain

the primary competitive advantage. This technology-driven cycle of equipment replacement is serving as the fundamental engine for sustained market growth.
