According to our (Global Info Research) latest study, the global Metasurface Customization Services market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Metasurface customization service is a high-tech service based on metasurface technology. Metasurface is an artificially designed optical surface that can perform extreme regulation on the light field, thereby achieving functions that traditional optical components cannot achieve. This technology is usually used in optical sensing, optical imaging, optical communications and other fields.

In the metasurface customization service, the service provider designs and manufactures special metasurface structures according to the specific needs of the customer. These metasurface structures can perform specific processing on the incident light, such as changing the polarization, phase, amplitude, etc. of the light to achieve the functions required by the customer.

For example, in the field of optical sensing, metasurface customization services can be used to manufacture high-precision displacement sensors. This sensor can convert tiny displacement information in the plane into obvious changes in light intensity, thereby accurately measuring displacement by measuring changes in light intensity. This technology has the advantages of high precision, large range, and non-contact measurement, and can be widely used in precision manufacturing, biomedicine, aerospace and other fields.

In addition, metasurface customization services can also be used to manufacture

special optical components, such as lenses, gratings, etc., which can achieve functions that traditional optical components cannot achieve, such as unconventional focusing, beam splitting, and wavefront shaping of light.
