According to our (Global Info Research) latest study, the global Methane Gas Detectors market size was valued at US$ 187 million in 2025 and is forecast to a readjusted size of US$ 255 million by 2032 with a CAGR of 4.6% during review period.

Methane Gas Detector is a device used to measure methane concentration. It emits a laser beam to the target and then detects the deflected light reflected from the target to measure the methane concentration between the detector and the target. Therefore, it is also called laser Methane Gas Detector. Laser Methane Gas Detector is a type of laser gas detector, and the technical principles are basically similar. At present, most laser gas detectors on the market are still dominated by Methane Gas Detector.

Laser Gas Detectors are devices that detect gas concentrations at a long distance. Users do not need to approach the detection point. The detector emits lasers to the detection point to measure the gas concentration between the detection point and the instrument. Generally, most distances are 50m/100m/150m, and the maximum can reach 200m or more.

The detector is mainly composed of an optical module, a signal processing module, a display and alarm module, and a shell component. Based on the principle of TDLAS technology, the concentration of special gases is measured. TDLAS technology is not affected by the surrounding detection environment, ensuring the high stability of the detection of specific gas concentrations. For example, Laser Methane Detector can only detect the concentration of methane, avoiding the influence of the surrounding mixed gas concentration and achieving accurate detection.

With the development of downstream industries such as oil and gas, and chemicals, it is necessary to detect the gas concentration around the factory to ensure safety. For example, for oil and gas pipeline systems, Methane Gas Detector can be used to monitor the gas concentration in the pipeline, especially harmful gases or leaking substances. It can help to detect pipeline leaks or abnormal conditions in a timely manner, and take timely measures to repair them.

Methane Gas Detector is generally available in handheld, fixed, and vehicle/aircraft types. Different types have different effects, and there are also large differences in price. The handheld type is a more affordable device, with a price range of 10,000-40,000 RMB. The handheld type is generally used for inspections, such as factory inspectors, government inspectors, etc. The fixed type can be monitored 24 hours a day and is suitable for installation in the factory. The vehicle/aircraft type is suitable for large-scale inspections, but it is relatively expensive, and basically the matching price is between hundreds of thousands and one million RMB.

With the development of science and technology, the functions and performance of Methane Gas Detector are constantly improving, including measurement accuracy, ranging range, real-time monitoring capabilities, etc. Methane Gas Detector has the advantages of non-contact, high precision and fast response, and can achieve real-time monitoring and quantitative analysis. With the further improvement of laser technology, sensor technology and data analysis capabilities, the performance and reliability of Methane Gas Detector will be enhanced, further promoting its application in various downstream markets.
