Cavity size is the major determinant as to which cyclodextrin is used in complexation. The cavity diameter of ?-cyclodextrins or ?-glucopyranose unit compounds is well-suited for use with molecules the size of hormones, vitamins and many compounds frequently used in tissue and cell culture applications. For this reason, ?-cyclodextrin is most commonly used as a complexing agent. It is used to increase the solubility of non-polar substances such as fatty acids, lipids, vitamins and cholesterol for use in cell culture applications. Methyl-?-cyclodextrin is used to remove cholesterol from cultured cells and is employed to remove lipid rafts.
