Abstracts

According to our (Global Info Research) latest study, the global Methyl Nitrite market size was valued at US\$ 125 million in 2025 and is forecast to a readjusted size of US\$ 176 million by 2032 with a CAGR of 5.1% during review period.

Methyl Nitrite is the simplest alkyl nitrite, a highly volatile, flammable, and unstable organic compound formed by the reaction of methanol with nitrosating agents such as sodium nitrite and mineral acids. It is mainly used as a laboratory reagent and intermediate in organic synthesis, photochemistry research, atmospheric chemistry studies, and specialized chemical processes rather than as a large-volume commercial product due to its limited stability and storage challenges. The supply chain begins with upstream raw materials including methanol, sodium nitrite, nitric acid, and other nitrosation reagents supplied by the petrochemical and inorganic chemical industries. Midstream activities involve the controlled synthesis, purification, stabilization, packaging, and distribution of methyl nitrite by specialty chemical manufacturers and research-chemical producers, often in small batches under strict safety conditions. Downstream demand comes primarily from academic research institutions, chemical laboratories, pharmaceutical and fine chemical R&D organizations, atmospheric and combustion research centers, and specialty chemical developers that utilize methyl nitrite as a reaction intermediate, radical initiator, or research material. In 2025, global Methyl Nitrite output was about 70,000 tons with 90,000 tons of capacity, average prices of USD 1,500-3,000 per ton, and gross margins around 26%.
