## Abstracts

Methylal is manufactured by oxidizing methanol or through reaction of formaldehyde and methanol. It is a clear, colourless flammable liquid with a low boiling point, low viscosity, and excellent dissolving power. Methylal is soluble in water and miscible with most common organic solvents. It is therefore used primarily as a solvent in the manufacturing of resins, adhesives, paint strippers, and protective coatings.

Scope of the Report:

This report focuses on the Methylal in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Methanol and formaldehyde are the main raw materials. Most manufacturers produce raw materials by themselves.

Methylal is often applied in solvents, polymers, fuel additive and others, of which solvent industry occupies the largest share. Methylal in China was banned to add in fuel additive in 2014. The proportion of application in the fuel additive has reduced a lot since then.

The price of methylal keeps decreasing in 2015 owing to raw material price. The price is at about 475 - 1601 USD/MT in 2015. The price is closely related to the purity of methylal. High purity methylal (more than 99%) is significantly higher than the lower purity product (86%~90%). The product profit margin is about 8.36 % - 24.12% in 2015. In the next few years, we predict that price will continue to decline. As competition intensifies, prices gap between different brands will go narrowing.

The worldwide market for Methylal is expected to grow at a CAGR of roughly -1.4%

over the next five years, will reach 460 million US\$ in 2023, from 500 million US\$ in 2017, according to a new GIR (Global Info Research) study.
