## Abstracts

The global Methylamine market size is expected to reach \$ 4316 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

Global sales of methylamine reached 2,190 K tons in 2025, with an average price of US\$1,268 per ton.

Methylamine is an organic compound with a formula of  $\text{CH}_3\text{NH}_2$ . This colorless gas is a derivative of ammonia, but with one hydrogen atom being replaced by a methyl group. It is the simplest primary amine. It is sold as a solution in methanol, ethanol, tetrahydrofuran, or water, or as the anhydrous gas in pressurized metal containers. Industrially, methylamine is transported in its anhydrous form in pressurized railcars and tank trailers. It has a strong odor similar to fish. Methylamine is used as a building block for the synthesis of many other commercially available compounds. Generally speaking, there are two forms of methylamine: gas and liquid. In our report, gas will be turned into the form of liquid when calculated. That's to say, we do research based on that 1 MT gas type methylamine is equal to 2 MT liquid type methylamine.

The core raw materials for methylamine production are methanol and liquid ammonia, which together account for 75-85% of the total production cost. For example, a 100,000-ton-per-year methylamine plant requires approximately 143,200 tons of methanol and 44,800 tons of liquid ammonia annually. The molar ratio of methanol to ammonia is typically adjustable between 1:1.5 and 1:4. Methanol prices are significantly affected by fluctuations in the prices of basic energy sources such as coal and natural gas. Between 2022 and 2024, global methanol prices fluctuated wildly between \$250 and \$400 per ton. Liquid ammonia costs, on the other hand, are highly correlated with natural gas prices; in early 2023, the energy crisis in Europe led to a 15% increase in

ammonia prices. Energy costs (steam and electricity) account for approximately 15-20%, as the reaction requires a high temperature of 425°C and a high pressure of 2.45 MPa, making compressor and steam consumption the main energy expenditures. Catalyst (aluminosilicate molecular sieve) and labor maintenance costs each account for approximately 3-5%. It is worth noting that methylamine plants can reduce steam consumption through thermal integration optimization (such as using waste heat to preheat feedstock and multi-effect distillation), and the investment payback period for advanced plants can be shortened to about two years. Currently, the industry is exploring the use of green alcohols (biomass methanol) and green ammonia (ammonia produced from renewable energy) to replace traditional gray hydrogen feedstocks in order to achieve carbon reduction throughout the entire life cycle.

This report studies the global Methylamine production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Methylamine and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
