## Abstracts

According to our (Global Info Research) latest study, the global Methylammonium Chloride market size was valued at US\$ 261 million in 2025 and is forecast to a readjusted size of US\$ 410 million by 2032 with a CAGR of 6.6% during review period.

Methylammonium Chloride ( $\text{CH}_3\text{NH}_2\text{Cl}$ ) is a quaternary ammonium salt widely used as a chemical intermediate in pharmaceuticals, agrochemicals, and especially in advanced materials such as perovskite precursors for optoelectronics (e.g., solar cells and LEDs). Its supply chain begins upstream with basic feedstocks including methylamine (derived from methanol and ammonia) and hydrogen chloride (from chlor-alkali or chemical synthesis processes). In the midstream, these raw materials undergo neutralization and crystallization to produce high-purity methylammonium chloride, often followed by purification, drying, and packaging depending on application grade (industrial, pharmaceutical, or electronic grade). Downstream, it is distributed to industries such as pharmaceuticals (API synthesis), agriculture (pesticide intermediates), and semiconductor/energy sectors (perovskite materials for next-generation photovoltaics). The supply chain is moderately specialized, with higher entry barriers in electronic-grade production due to purity requirements and process control, while industrial-grade production is more commoditized and widely available. In 2025, global Methylammonium Chloride output was about 150,000 tons with 190,000 tons of capacity, average prices of USD 1,500-2,900 per ton, and gross margins around 27%.
