According to our (Global Info Research) latest study, the global MHC-Peptide Tetramer market size was valued at US\$ 216 million in 2025 and is forecast to a readjusted size of US\$ 425 million by 2032 with a CAGR of 10.3% during review period.

An MHC tetramer is a laboratory tool used to study antigen-specific T cells. It consists of four major histocompatibility complex (MHC) molecules bound to a specific peptide and labeled with a fluorescent tag. These tetramers can bind to T cell receptors (TCRs) on the surface of T cells that recognize the specific peptide-MHC complex. By using flow cytometry, researchers can identify and quantify antigen-specific T cells, making MHC tetramers a valuable tool for immunological studies, including vaccine development, cancer immunotherapy, and infectious disease research.

Increased focus on cancer immunotherapy and adoptive T cell therapies is driving demand for MHC tetramers to study antigen-specific T cell responses.
