According to our (Global Info Research) latest study, the global Michelson Interferometer market size was valued at USD 88 million in 2023 and is forecast to a readjusted size of USD 111.4 million by 2030 with a CAGR of 3.3% during review period.

The Michelson interferometer is a common configuration for optical interferometry and was invented by Albert Abraham Michelson. Using a beam splitter, a light source is split into two arms. Each of those light beams is reflected back toward the beamsplitter which then combines their amplitudes using the superposition principle. The resulting interference pattern that is not directed back toward the source is typically directed to some type of photoelectric detector or camera. For different applications of the interferometer, the two light paths can be with different lengths or incorporate optical elements or even materials under test.
