According to our (Global Info Research) latest study, the global Micro-Electrostatic Air Purifier market size was valued at US\$ 671 million in 2024 and is forecast to a readjusted size of USD 923 million by 2031 with a CAGR of 4.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The main component of the micro-electrostatic air purifier is the electrostatic adsorption device. The micro-electrostatic adsorption device is composed of a discharge wire and a negative plate. Under the action of the high-voltage generator, the electrostatic adsorption device can generate a DC high voltage voltage of 4KV-8KV and form a strong electrostatic field inside the electrostatic adsorption device. When the indoor air passes through the electrostatic adsorption device, the particles in the air (including microorganisms) are forced to carry a positive charge and are adsorbed onto the negative plate.
