The global Micro-LED Display Module market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Micro-LED, also known as micro-light-emitting diode, refers to a high-density integrated LED array. The distance between LED pixels in the array is within 50um, and each LED pixel can emit light by itself. Miniaturization enables Micro LED to have higher luminous brightness, resolution and color saturation, as well as faster display response speed. It is expected to be applied to augmented reality (AR) micro-projection devices and automotive head-up displays that require high brightness. (HUD) projection applications, super large display billboards and other special display application products, and are expected to expand to wearable/implantable devices, virtual reality (VR), optical communication/optical interconnection, medical detection, smart car lights, space imaging and many other fields.
