## Abstracts

The global Micro-nano 3D Printer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The micro-nano 3D printer is a micro-electromechanical system developed based on the principle of EHD jet printing for the manufacture of complex three-dimensional structures at the micro-nano scale. The 3D printer integrates a variety of printing modes, and can complete various printing methods such as electrospinning, electrostatic printing, and electrostatic spraying on one device, and realize structural materials (plastics, polymers, etc.), conductive materials (liquid metal, nano Silver conductive ink, etc.), dielectric materials (various insulating materials), semiconductor materials and other materials, the printed structure characteristic structure size covers macro/micro/nano multi-scale and cross-scale. In particular, it breaks through the constraints of the current commercial 3D printing that requires a support layer. Combined with a variety of printing nozzles, it can realize the integrated manufacturing of cross-scale, multi-material and complex 3D structures, such as 3D interconnected long flow channels, movable membrane cavities and other typical structures. multi-level micro-nano structure. Therefore, it is widely used in micro-nano electromechanical systems, biomedicine, tissue engineering, new materials, new energy sources, high-definition displays, microfluidic devices, micro-nano optical devices, micro-nano sensors, micro-nano electronics, biochips, optoelectronics and printed electronics, etc. There is a huge industrial demand in the field.
