Abstracts

The global Micro-nano Level 3D Printing market size is expected to reach \$ 154.2 million by 2029, rising at a market growth of 5.1% CAGR during the forecast period (2023-2029).

Micro-nano level 3D printing is an advancing manufacturing technology with a gradually expanding market. As technology progresses, micro-nano level 3D printing finds widespread applications in fields such as healthcare, electronics, and optoelectronics. In healthcare, this technology is utilized for producing biocompatible personalized medical devices and human tissue models. In the electronics sector, it supports the manufacturing of miniature sensors and high-performance electronic devices. Furthermore, the optoelectronics industry has discovered innovative applications in micro-nano level 3D printing, including micro-optical devices and photonic crystals. Looking ahead, with increasing demands for precision in micro-nano manufacturing and multi-material printing, the technology is poised for continued development across various industries, fostering the emergence of cutting-edge technologies.

Two-Photon Polymerization (TPP) is a maskless direct laser writing technology. With TPP, the light-matter interaction only takes place within the volume of a focused laser spot. The simultaneous absorption of two photons in the focused spot triggers the locally confined polymerization of an exposed photosensitive material. This laser focus can be moved throughout the volume of the photoresist in all three dimensions, allowing for complex 3D structures to be written along the laser's trajectory.
