## Abstracts

The global Micro Repeater market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The repeater is composed of antenna, RF duplexer, low noise amplifier, mixer, electrically modulated attenuator, filter, power amplifier and other components or modules, including uplink and downlink amplification links. The basic principle of its operation is to use the forward antenna (donor antenna) to receive the downlink signal of the base station into the repeater, amplify the useful signal through the low-noise amplifier, suppress the noise signal in the signal, and improve the signal-to-noise ratio (S/N); Then it is down-converted to IF signal, filtered by filter, amplified by IF, up-converted to RF by frequency shift, amplified by power amplifier, and transmitted to mobile station by backward antenna (retransmission antenna); At the same time, the backward antenna is used to receive the uplink signal of the mobile station, and it is processed by the uplink amplification link along the opposite path: it is transmitted to the base station through the low-noise amplifier, downconverter, filter, intermediate amplifier, upconverter and power amplifier. So as to achieve two-way communication between the base station and the mobile station.
