Nanocellulose is a term referring to nano-structured cellulose. This may be either cellulose nanofibers (CNF), also called microfibrillated cellulose (MFC), nanocrystalline cellulose (NCC or CNC), or bacterial nanocellulose, which refers to nano-structured cellulose produced by bacteria.

Nanocellulose is produced from plant/tree through cellulose extraction or cellulose derived from bacteria via a culture medium.

Some parameters of nanocelluloses are as follows:

Diameter: 5 nm - 500 nm.

Length: 10s nm - 100s μ m.

Specific surface area: 10s - 100s of m²/g.

Nnanocellulose have many special properties, such as Natural & renewable, Biodegradability, Biocompatibility, High strength & modulus, High surface area, High aspect ratio, Chemical functionality (e.g. for modification), Dimensional stability, Moisture absorption, Thermal stability (~200°C), etc.

Scope of the Report:

This report focuses on the Microbial and Bacterial Cellulose in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. In the future, the production and consumption is estimated to continue developing with a relatively high growth rate. To meet the large and increasing demand, more and more manufacturers will go into this industry. End industries such as automobiles, paper &

pulp industry and so on.

The price of nanocellulose differs from company to company, as there is a great difference among the nanocellulose quality from different regions.

Although the market competition of nanocellulose is fierce globally, there are many enterprises can obtain considerable profit from the manufacturing and marketing of nanocellulose and that is the reason that we believe there will also be enterprises enter this market. But it is suggested that enterprises those have plans to enter this industry have careful analysis of this market and the advantages or disadvantages of themselves.

The worldwide market for Microbial and Bacterial Cellulose is expected to grow at a CAGR of roughly 14.8% over the next five years, will reach 570 million US\$ in 2023, from 250 million US\$ in 2017, according to a new GIR (Global Info Research) study.
