According to our (Global Info Research) latest study, the global Microbial Soil Remediator market size was valued at US\$ 1886 million in 2024 and is forecast to a readjusted size of USD 2964 million by 2031 with a CAGR of 6.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Microbial soil remediation agents mainly use active microorganisms to degrade, transform or fix pollutants in the soil through their life metabolic activities, thereby achieving the purpose of repairing soil pollution, improving soil structure and improving soil fertility. These microorganisms can be indigenous microorganisms in the soil or efficient functional strains that have been artificially domesticated, screened and cultivated. The composition of microbial soil remediation agents is diverse, but usually contains a variety of beneficial microbial strains, such as photosynthetic bacteria, *Bacillus subtilis*, yeast and actinomycetes. These strains are fermented and cultured under specific conditions to form a remediation agent containing a large number of active microorganisms and their metabolites. For example, studies have shown that efficient microbial soil remediation agents can be mixed with fermentation broths of photosynthetic bacteria, *Bacillus subtilis*, yeast and actinomycetes in a certain proportion (the volume percentage of each fermentation broth is: photosynthetic bacteria 10-25%, *Bacillus subtilis* 25-35%, yeast 20-35%, actinomycetes 20-40%).
