Abstracts

The global Microbiome Therapeutics market size is expected to reach \$ 4251 million by 2032, rising at a market growth of 29.8% CAGR during the forecast period (2026-2032).

Microbiome Therapeutics refers to novel therapeutic approaches that utilize modulation of the human microbiome—especially gut microbiota—to treat or prevent diseases. These therapies include live biotherapeutic products (LBPs), fecal microbiota transplantation (FMT), engineered bacteria, and microbiota-derived metabolites aimed at rebalancing microbial ecosystems. They are being developed for a wide range of conditions, including metabolic disorders, immune dysfunction, neurological diseases, inflammatory bowel disease (IBD), and as adjuncts to cancer immunotherapy. Compared to traditional pharmaceuticals, microbiome-based therapies offer high specificity, personalization, and long-term safety, making them the “fourth therapeutic modality” following small molecules, biologics, and cell/gene therapies.

As the global push for personalized medicine, chronic disease management, and immune-oncology adjunct therapies gains momentum, microbiome therapeutics is entering a critical commercialization window. Regulatory agencies such as the FDA and EMA are streamlining approval pathways for live biotherapeutic products (LBPs), while landmark approvals of Rebyota and Vowst mark a turning point. Strategic alliances between biotech startups and global pharma are accelerating late-stage clinical programs, supported by both capital and platform synergies.

Despite its transformative potential, the microbiome therapeutics sector faces multiple uncertainties. Manufacturing and regulatory frameworks remain inconsistent across countries, slowing clinical translation. Microbiota therapies face inherent variability and complexity, posing challenges in standardizing efficacy and trial design. Technical

bottlenecks in sample sourcing, cold-chain logistics, and microbial viability maintenance elevate development costs. Additionally, market education and patient acceptance still require time, particularly in emerging regions like Asia, where applications are largely limited to early-stage R&D and clinical trials.

Demand is expanding beyond gastrointestinal conditions into systemic diseases such as IBD, recurrent *Clostridioides difficile* infection (CDI), cancer immunotherapy, Parkinson's, and autism spectrum disorders. Partnerships between CROs and pharma are intensifying, while genomics, metabolomics, and AI are enabling high-throughput microbial strain screening. The clinical sector is seeking more reproducible, orally deliverable LBPs and microbiome-derived metabolite products, which align with industrial scalability. With public and private insurers beginning to cover these new modalities, microbiome therapeutics is on the path to becoming a standard pillar of precision medicine.
