Abstracts

Contrast media, also known as contrast agents, is a substance that is usually transparent to X-rays and is used in medical imaging to speed up the contrast of fluids or structures. Microbubbles are used as a blood pool agent for contrast ultrasound imaging in cardiology and radiology. They are widely used in gene therapy, stem cell delivery, drug delivery, molecular imaging, and other applications. Microbubbles can also be used in conjunction with ligand molecules that target molecular markers of disease. The main purpose of microbubble-based ultrasound contrast agents is to monitor the biomarker condition of vascular endothelium, image inflammation, and visualise tumour vasculature, among other things.
