Abstracts

The global Microencapsulated Feed market size is expected to reach \$ 150.4 million by 2029, rising at a market growth of 8.2% CAGR during the forecast period (2023-2029).

Microencapsulation is a process in which liquids and particulate dietary components are enclosed within a carefully engineered wall. Capsules consist of a wall and the internal nutrients are released at the active sites within the target biological system of fish or shrimp larvae. The wall or shell dissolution can be accomplished by rupture, enzymatic action, pH change or bacterial action in fish or shrimp larval body system. The wall could be a bio-degradable polymer i.e., modified gelatin, wherein the nutrients within the capsule could be released by the enzymatic processes of the animal or by micro-flora present in its gut. Capsules smaller than 20 microns in diameter are reported to be possible, allowing the culturist a wide range of sizes of nutritionally diverse capsules to satisfy the different growth stages of the particular species.

This report studies the global Microencapsulated Feed production, demand, key manufacturers, and key regions.
