Abstracts

According to our (Global Info Research) latest study, the global Microencapsulation Solutions market size was valued at US$ 2830 million in 2024 and is forecast to a readjusted size of USD 6874 million by 2031 with a CAGR of 13.7% during review period.

Microgel solutions refer to 'microencapsulation' technology. The principle is to embed solid, liquid or gas materials in micro-capsules measured in microns, and control the expected release of the embedded materials under certain conditions. Through this embedding and release process, on the one hand, the material can be protected before it is released, and the material can be fully functional by controlling the release method, time, speed and amount.

The microgel solution uses a polymer material film that can withstand the production technology and process environment to wrap the raw material and make a microcapsule so that it will no longer be affected by the external environment during production and processing. At the right time and under the right conditions, it is released from the wrapping film under the control of the release time, mode, rate and quantity, so that its function can be optimized. Due to the many advantages of microgel technology, it can be widely used in food, industry, manufacturing, agriculture, pharmaceutical and other sectors. In the future, the prospect of microgel technology is good.
