Microfluidic chip in biomedical field is an integrated chip that integrates microscale channels and microfluidic technology, which is specially used in biomedical research, biological analysis and biological detection. In the biomedical field, microfluidic chips integrate or basically integrate the basic operating units such as sample preparation, reaction, separation, detection, cell culture, sorting, and lysis involved in fields such as chemistry and biology onto a chip of a few square centimeters or even smaller. A network is formed by microchannels, and controllable fluids run through the entire system to realize various functions of different laboratories such as conventional chemistry, biology, materials, and optics.
