According to our (Global Info Research) latest study, the global Microparticle Chemiluminescence Reagent market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Microparticle chemiluminescence reagent (MCR) is a reagent used for immunoassay to detect the presence of specific antibodies or antigens in samples. MCRs are composed of small particles coated with specific antigens or antibodies, which can bind to the corresponding antibodies or antigens in the sample. When particles combine with target molecules, they trigger a chemiluminescence reaction, producing light that can be detected using specialized instruments. The intensity of the generated light is proportional to the weight of the target molecule present in the sample for quantitative analysis.
