According to our (Global Info Research) latest study, the global Microporous Composite Copper Foil market size was valued at US\$ 105 million in 2025 and is forecast to a readjusted size of US\$ 787 million by 2032 with a CAGR of 34.2% during review period.

Microporous Composite Copper Foil is an advanced current collector material designed with a microporous structure to enhance electrolyte infiltration and improve interfacial contact in next-generation battery systems. It is produced by depositing ultra-thin copper layers on both sides of a polymer base film through vacuum deposition technology, forming a lightweight composite that maintains high electrical conductivity while optimizing ion transport and mechanical stability. Its advantages include superior safety, reduced copper usage, enhanced energy density, and improved electrochemical interface performance. The capacity utilization rate in 2025 reached 70%, and the industry's average gross margin was approximately 29%. Production in 2025 totaled 34 million sqm at an average price of 3 USD per sqm. The upstream segment mainly consists of PET and PP base films, copper sputtering targets, and magnetron sputtering equipment, with representative suppliers including Jiangsu Shuangxing, Wanhua Chemical, GRINM Advanced Materials, and Dongwei Technology. The midstream focuses on base film surface treatment, magnetron sputtering copper deposition, multilayer structure formation, and quality control to ensure conductivity, adhesion, and structural integrity. Downstream applications are primarily in power batteries and consumer electronics batteries, with key customers including Tesla, CATL, BYD, Samsung SDI, and LG Energy Solution.
