According to our (Global Info Research) latest study, the global Microsphere Foaming Agent market size was valued at US\$ 543 million in 2024 and is forecast to a readjusted size of USD 780 million by 2031 with a CAGR of 5.3% during review period.

A microsphere foaming agent is a type of additive used in various industrial applications, particularly in the production of foamed materials. These agents consist of tiny, hollow spheres (microspheres) that expand when exposed to heat or chemical activation. The expansion of the microspheres creates a cellular structure, resulting in the formation of a lightweight, low-density material. This process is commonly employed in applications such as thermoplastic processing, rubber compounding, and coatings.
