According to our (Global Info Research) latest study, the global Microsurgery market size was valued at US\$ 3141 million in 2025 and is forecast to a readjusted size of US\$ 4149 million by 2032 with a CAGR of 4.1% during review period.

This article mainly counts medical equipment used in microsurgery, such as surgical microscopes, instruments (pliers, tweezers, etc.), and suture materials.

The prices of different types of equipment vary greatly, and so does their value. Among them, microsurgery microscopes account for the largest share of value, nearly 70%. In 2024, the global average price of microsurgery microscopes will be around US\$280,000, and the production volume will be approximately 7,200 units.

Microsurgery is a key development in modern surgery. It involves surgeons using the high magnification of surgical microscopes, combined with sophisticated microsurgical instruments and ultra-fine suture materials, to precisely manipulate tiny blood vessels, nerves, and other delicate tissues. Compared to traditional open surgery, microsurgery significantly reduces surgical trauma and the risk of complications, resulting in less pain and faster recovery for patients. With continuous advances in mechanical manufacturing, optical imaging, electronic control, and information technology, surgical procedures are rapidly evolving toward the goal of 'less trauma, faster recovery, and better functional restoration.' Microsurgery is considered one of the most minimally invasive and precise forms of minimally invasive surgery, with incisions capable of being reduced to millimeter levels.

Microsurgical equipment, including surgical microscopes, cutting tools, microforceps, tweezers, hemostatic clips, and microsuture materials, forms the core of this

technology. These instruments require not only high precision and stability but also ergonomic comfort for prolonged operation. At present, microsurgical equipment has been widely used in many clinical fields such as ophthalmology, otolaryngology, plastic and reconstructive surgery, orthopedics, cardiology and neurosurgery. Typical applications include cataract removal, tympanoplasty in otology, replantation of severed fingers/limbs, breast reconstruction after breast cancer surgery, microvascular bypass and intracranial aneurysm clipping.
