According to our (Global Info Research) latest study, the global Microwave Remote Sensing market size was valued at US$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Microwave remote sensing uses microwave equipment to detect and receive the electromagnetic radiation and scattering characteristics of the measured object in the microwave band (wavelength is one millimeter to one meter) to identify distant objects. Compared with visible light and infrared remote sensing technology, microwave remote sensing technology has the ability to work all day and night, can penetrate clouds, and is not easily affected by meteorological conditions and sunlight levels; it can penetrate vegetation, and has the ability to detect subsurface targets; the microwave image obtained The image has obvious three-dimensional sense and can provide information other than visible light photography and infrared remote sensing.
